DSEH004 · PERFORMANCE MANAGEMENT AND EMPLOYEE ENGAGEMENT

Reading Pulse Data Honestly

Week 6 · Lecture 2 · Unit III · Driver analysis, regression to the mean, nonresponse, common method bias and dashboard theatre

R K Singh
Senior Professor, Department of Commerce, Delhi School of Economics, University of Delhi

L2 · COMMIT BEFORE THEORY

Engagement rose by 0.2 after our intervention, so the intervention worked.

List three other explanations before accepting it.

What a driver chart really shows

The method

Regress engagement on item scores; the largest weights are called drivers.

JOHNSON AND LEBRETON (2004)

The trap

Correlated predictors split their weight unpredictably. Relative importance methods are needed.

The limit

A driver is a statistical association, not proof that changing it changes engagement.

Why a change may not be a result

ERROR	WHAT HAPPENS
Regression to the mean	Units chosen because they scored worst tend to score better next time anyway
Survivorship	Those who left are no longer in the survey
Nonresponse	Who answers differs from who does not
Common method bias	One survey, one respondent, inflated correlations
Points against percent	A rise from 20 to 25 percent is 5 points, not 5 percent

Barnett et al. (2005); Rogelberg and Stanton (2007); Podsakoff et al. (2003)

L2 · DASHBOARD THEATRE

When the display replaces the decision

Symptoms

Many colors, no comparison group, no confidence interval, no action owner.

ROGELBERG AND STANTON (2007)

Survey fatigue

Frequent surveys without visible action lower response and trust.

L2 · EXERCISE

Critique a sample dashboard

1 **Compare**
What is each number compared with?

2 **Who is missing**
Who did not respond, and who has already left?

3 **Decide**
Which single decision should this dashboard drive?

L2 · DATA RULE

Every figure you cite comes from the dataset, computed with the column letters named in the Data Brief. Never estimate an aggregate.
