WEEK 6 · LECTURE L2 OF 3 · UNIT II

Integration and User Adoption

Why a stack of good tools becomes a bad system, and why people still do not use what was built for them.

Part 1 Point solutions, integrated suites, data silos and APIs

Part 2 UTAUT, change management and champions

Part 3 Exercise: diagnose why a good tool failed at GreenLeaf

Read Venkatesh et al. (2003); Manuti and de Palma (2018), Chapters 4 and 5

R K Singh · Senior Professor, Department of Commerce · Delhi School of Economics, University of Delhi · DSEH001 · M.Com. PGCF 2025

PART 1 · INTEGRATION

Sixteen systems means 120 possible connections

120

The arithmetic

With n systems, the possible point-to-point links are n(n−1)/2. For 16 systems, that is 120.

A data silo

Data locked in one system that others cannot read, so people re-key it by hand.

An API, in plain terms

An agreed way for one system to ask another for data, like a counter window with a fixed form.

AT GREENLEAF

Spreadsheet Trackers have zero integrations and adoption 1.00. They are where the silos meet, by hand. Source: TechStack_Inventory, Integration_Points.

PART 2 · ADOPTION DATA

Use rises with literacy and device, not with training

Factor	Group	Active use (Adoption or Advocacy)
Digital literacy	Score 1 · 2 · 3 · 4 · 5	0.0% · 5.8% · 57.5% · 89.7% · 100%
Device	Feature phone · Smartphone only	0.0% · 14.2%
Device	Both · Laptop	77.2% · 98.6%
Training module	Completed · Not completed	44.0% · 45.6%

READ IT

The jump between literacy scores 2 and 3 holds most of the gap. Training made no difference. Source: Adoption_Telemetry, 480 users.

PART 2 · CHANGE AND CHAMPIONS

People adopt through people

Champions

Trusted peers who use the tool and help others. In the data, the Advocacy stage marks them.

Where they are

Advocates are 94% of laptop users but 3% of smartphone-only users. Champions are missing exactly where they are needed.

The fix

Recruit store-level champions among smartphone users, give them time, and recognize the help they give.

SOURCE Adoption_Telemetry, Adoption_Stage by Device_Access.

PART 3 · EXERCISE

Diagnose why a good tool failed at GreenLeaf

Step	Question to answer
1 · Choose	Pick one tool: ESS App (0.41), PulseEngage (0.30) or WellbeingPlus (0.18).
2 · Locate	Which UTAUT factor fails: performance, effort, social influence or facilitating conditions?
3 · Evidence	Name the column that shows it, for example Device_Access or Digital_Literacy_Score.
4 · Fix	Propose one change that targets that factor, not a generic retraining.

THE TEST If your fix would work equally well for every factor, it does not diagnose anything.

Going deeper: the theory underneath adoption

The next slides set out TAM2 and TAM3, van Dijk's successive access, Granovetter's weak ties, and Kotter's eight steps: what each claims, how it works, where it breaks, and what it means at GreenLeaf.

THEORY IN DEPTH · VENKATESH AND DAVIS (2000); VENKATESH AND BALA (2008)

Why people find a system useful or easy

THE CORE IDEA

TAM2 and TAM3 explain where the two TAM beliefs come from, not just their effect.

HOW IT WORKS

Usefulness grows with job relevance, output quality and visible results. Ease of use grows with computer confidence and hands-on experience.

LIMITS AND CRITIQUE

The models grow long and specific, and still explain intention better than real use.

AT GREENLEAF

Show a store associate a result she cares about, such as leave approved in minutes, and usefulness follows.

THEORY IN DEPTH · VAN DIJK (2005)

Access comes in four successive stages

THE CORE IDEA

Digital access is not a yes-or-no switch but four stages, each needing the one before.

HOW IT WORKS

Motivation, then physical access, then skills, then actual use. A gap at any stage stops the rest.

LIMITS AND CRITIQUE

The stages overlap in real life, and motivation can follow skill rather than precede it.

AT GREENLEAF

Feature phone users fail at physical access; many smartphone users fail at skills. Each needs a different remedy.

THEORY IN DEPTH · GRANOVETTER (1973)

New ideas travel through weak ties

THE CORE IDEA

Weak ties, such as acquaintances in other groups, carry new information farther than close friends do.

HOW IT WORKS

Close friends know what you know. Bridges between groups bring in the new.

LIMITS AND CRITIQUE

Strong ties matter more for trust and for adopting risky changes.

AT GREENLEAF

A champion who visits several stores spreads awareness; a trusted co-worker in the same store drives actual use.

THEORY IN DEPTH · KOTTER (1996)

Eight steps, and most failures are in the first three

THE CORE IDEA

Urgency, a guiding coalition, a vision, communication, removing obstacles, short-term wins, consolidating, anchoring in culture.

HOW IT WORKS

Kotter found that skipping early steps produced the illusion of speed and then failure.

LIMITS AND CRITIQUE

A top-down sequence; critics say real change loops back and needs more bottom-up voice.

AT GREENLEAF

Removing obstacles at GreenLeaf means devices and language, not more announcements.

TAKEAWAYS

Three things to carry out of this lecture

1

Every extra system multiplies the connections that must work.

2

Diagnose which adoption factor fails before choosing a fix.

3

Champions must sit where adoption is lowest.

NEXT Course correction: when to scale, fix, retrain or pause.
