WEEK 12 · LECTURE L2 OF 3 · UNIT IV

Final Pod Presentations Part 2

The remaining pods present; peer voting on coherence and feasibility; the strongest themes.

Part 1	Remaining pods present
Part 2	Peer voting: most coherent, most feasible
Part 3	Debrief on the strongest themes
Read	No new reading; pods present

R K Singh · Senior Professor, Department of Commerce · Delhi School of Economics, University of Delhi · DSEH001 · M.Com. PGCF 2025

PART 2 · PEER VOTING

Two criteria, judged separately

Most coherent

Does each round's decision follow from the last, as one thesis?

Most feasible

Could GreenLeaf actually do this within ₹6 crore, its people and its law?

HOW TO VOTE WELL

Vote independently before discussing. Do not vote for your own pod. Judge the case, not the presenters.

PART 3 · THEMES ACROSS THE COHORT

Questions for the debrief

Theme	Question
Access before training	Did plans fix devices and language before adding courses?
Fairness as design	Was fairness built in, or audited after?
Evidence that changed minds	Which pod changed course after new data, and was it right to?
The anchors	Whose plan worked best for all four people?

Going deeper: the theory underneath judging well

The next slides set out Surowiecki on the wisdom of crowds, the Condorcet jury theorem, hindsight bias, and the halo effect: what each claims, how it works, where it breaks, and what it means at GreenLeaf.

THEORY IN DEPTH · SUROWIECKI (2004)

Crowds judge well under four conditions

THE CORE IDEA

Groups can outperform experts when judgments are aggregated well.

HOW IT WORKS

Diversity of opinion, independence, decentralization, and a good method of aggregation.

LIMITS AND CRITIQUE

Crowds fail when people copy each other, as in bubbles and herding.

AT GREENLEAF Vote before discussion, so the class's judgment stays independent.

THEORY IN DEPTH · CONDORCET (1785)

Many independent voters are more often right

THE CORE IDEA

If each voter is more likely right than wrong and votes independently, majority accuracy rises with group size.

HOW IT WORKS

With voters only slightly better than chance, a large group is very likely correct.

LIMITS AND CRITIQUE

The theorem fails if voters are worse than chance or not independent.

AT GREENLEAF Peer voting works only if each student judges on the criteria, not on friendship.

THEORY IN DEPTH · FISCHHOFF (1975)

Hindsight makes the past look predictable

THE CORE IDEA

After learning an outcome, people believe they would have predicted it.

HOW IT WORKS

This makes us judge past decisions by results rather than by the information available at the time.

LIMITS AND CRITIQUE

Hard to remove; asking people to explain how other outcomes could have happened helps.

AT GREENLEAF

Judge each pod's Round 1 choice by what it knew in Round 1, not by what Round 4 later revealed.

THEORY IN DEPTH · THORNDIKE (1920); NISBETT AND WILSON (1977)

The halo effect

THE CORE IDEA

One good impression spreads to judgments of unrelated qualities.

HOW IT WORKS

A confident speaker or polished slides can lift ratings of the plan itself.

LIMITS AND CRITIQUE

Separate criteria and independent scoring reduce it.

AT GREENLEAF Score coherence and feasibility separately, and ignore how polished the slides look.

TAKEAWAYS

Three things to carry out of this lecture

1

Vote independently, on the criteria, not the presenters.

2

Judge past decisions by what was known at the time.

3

Coherence and feasibility are different virtues.

NEXT Synthesis and end-term preparation.
